Abstract (en)  
[origin: CA2154758A1] The invention relates to an appliance (G) for floor care having a driven care insert, such as for example a polisher disc (13), mounted on a carrier disc (10), and a special front or corner brush (B), which is releasably engageable, a drive for the brush (B) being effected after engagement by means of the rotating carrier disc (10), and the carrier disc (10) being mounted on an appliance housing (16) by provision of a bearing pin (18). In order to expose the appliance to the least possible negative influence by introduction of an external force, in respect of the drive performance, the invention proposes that on engagement of the brush (B), a line of action of the pressing force (F) between a drive wheel (48) which acts on the brush (B) and the carrier disc (10) extends through the axis (18) or at a close spacing to the axis (18).
