Abstract (en)

[origin: WO9504696A1] A device (5) for receiving and transporting objects, in particular strip- or ribbon-shaped materials wound into spools (30), has a base frame with at least one swivelling stay (8) and axes (9) mounted thereon for receiving the objects. Supporting brackets (10-13) provided on the base frame act as standing and if required protecting means. The receiving axes (9) and supporting brackets (10-13) may be swivelled from a compact rest position into a stable working and transport position. The device (5) is simple and economic to produce in series and may be used both in manufacturing and in overland transport. The device is useful for all sorts of wound strip- or ribbon-shaped objects and for all sorts of perforated disks or the like.
