Abstract (en)  
[origin: EP0682160A2] The spacer strip (L) has an undulating foot edge (1) and an upper top area (3) for supporting the mat. The upper narrow edge of the walls of the wavy sections (I,II) runs into the head area (3). The walls start from this point go through pointed roof type alternate angles on opposite sides of the head area form the undulating path of the foot edge. The spacer is formed from the flat band strip which is deformed through plastics extrusion into the undulating individual sections. In the area of one long edge the wavy sections are folded from a web (5) and then angled into opposite wavy sections. <IMAGE>
