Abstract (en)
[origin: GB2268167A] A dispensing closure device (10) for sealing engagement over the mouth of a container (11) comprises a body (12) with an orifice (16) therethrough, a stopper (17) mounted on the body (12) positionable within the orifice (16) and a cap (13) movable relative to the body (12) between open and closed positions. The cap (13) has closure means, e.g. in the form of cam means (25, 26), for retaining the stopper (17) in an orifice-closing position when the cap (13) is in its closed position and for enabling the stopper (17) to move out of its orifice-closing position when the cap (13) is in its open position. The stopper (17) is resiliently biased away from its orifice-closing position.
