Abstract (en)
[origin: EP0682893A1] A workstation equipment container comprises an outer shell having a rear wall (2), side plates (3), a front rail (4) and an open top in which an inner receptacle is pivotally mounted. The inner receptacle comprises a rear wall (5), side plates (6), a front rail (10) and a support (7) for supporting a faceplate (15) which is adapted to receive data management equipment such as a computer keyboard. The outer shell is adapted to be fixed to a desk or similar workstation and the pivotal connection (8, 9, 11) between the inner receptacle and the outer shell is such that the inner receptacle is normally stationary when the data management equipment is used but can be pivoted within the outer shell to adjust the angle of the receptacle relative to the shell when subjected to a force which is substantially greater than the force required to operate the data management equipment. <IMAGE>
