Abstract (en)  
[origin: EP0683104A1] The base section (13) of the stopper incorporates one or more stops (11a). These interact with the mating elements (42) of the container (40) and prevent the base section from twisting in the opening. The stops are formed as lobes on the side on the location flange (11) and protrude radially over the latter, and the mating elements on the container are formed as cams. The stops are formed as one piece on the base section and are elastic at least in the region of the connecting point on the base section. <IMAGE>
