Abstract (en)

[origin: WO9418494A1] A pocket lamp has an accessory rear lamp formed by a lens (14). By means of an optical fiber (3) which extends through the reflector (2) and partially projects into its inner space (25) a light input end is created into which the light emitted by the light source (1) is irradiated. The light output end of the optical fiber (3) lies in turn at the light input side of the lens (14), so that the light irradiated into the optical fiber (3) is coupled to the lens (14).
