Abstract (en)

[origin: WO9418528A1] A method for measuring at least one feature of a liquid solution by means of a measurement device including an elongate member (15) or gauge (15) extending into the solution along a predetermined axis and having a plurality of emitting (Ei) and receiving (Ri) electrode pairs along the longitudinal gauge axis (17), wherein, for each measurement, at least one value characterizing the received signal is extracted therefrom, the characteristic value is stored, and, for each electrode pair, the conductance related to each corresponding level is quantified.
