Abstract (en)
The waste collection system consists of a recipient (1) with two separate compartment to receive two different types of waste material, and a trolley with two separate bins to receive the waste from the recipients. The trolley is equipped with a hinged support (49) on the top between the two containers, designed to engage with the recipient to allow automatic emptying. As the recipient is engaged with the support, the base of its first compartment slides open, and the material inside it drops into the first bin (41). The support is then turned on its hinge (50), tipping the material from the other compartment of the recipient into the second bin (43), which is equipped with a retractable hood (45). <IMAGE>
