Abstract (en)
The door consists of a panel (1) which turns on hinges (5) inside a frame (6) made from two uprights (7,11). The panel and frame are symmetrical about a central horizontal line, so that the door can be inverted during installation to allow it to be right- or left-hand opening. Any holes (8,9,10) made in the door frame to receive fittings are either on the central line or located symmetrically on either side of it, and any holes not used on assembly are fitted with covers (14,15,19). The top of the door has a housing (22) containing a power cylinder for closing the door, while the base of the housing has two symmetrical fitting holes to allow it to be fitted either way round. <IMAGE>
