Abstract (en)

[origin: US5630365A] A rail loading train for transporting as well as loading and unloading long rails, includes a number of loading cars coupled together and having a frame which has a longitudinal axis and is supported on undercarriages for movement in an operating direction. Mounted on the loading cars are a plurality of rail supports which are spaced from each other longitudinally in direction of the frame and respectively rotatably mounted on support columns. Each rail support includes a separate pivot drive for swinging the rail support about a vertical axis between a receiving position in which the rail support extends perpendicular to the longitudinal axis and an idle position in which the rail support extends in direction of the longitudinal axis, whereby the position of the rail support in each end position is automatically secured by a locking mechanism once the swinging motion is concluded.
