Abstract (en)  
[origin: EP0685684A2] The supply duct is connected to a combustion boiler of the essentially closed type, for installation in a room of a building, and for opening out into the atmosphere. The ducts are in fluid communication of a transition part with controllable shut-off element if the shut-off element is in the open position. The shut-off element is controlled between the open and the closed position depending on the pressure prevailing in the air supply duct. A combustion air injection duct (4) runs between the combustion boiler and the combustion air discharge duct. The combustion air injection duct opens out into the combustion air discharge duct downstream of the place where the transition part opens out into the combustion air supply duct. <IMAGE>
