Abstract (en)

[origin: EP0685828A1] Directions to the mobiles (28, 31, 32) to follow selected routes (eg. 29) to their allotted parking spaces (30) are encoded in the data words from fixed transmitters (35-40). Each data words contains two directional bits characterising the course of the mobile addressed, a change-of-direction bit and at least one check digit. The change-of-direction bit serves to adapt the directional bits after changes of course. The infrared transmitters and receivers operate in accordance with pulse pause modulation, yielding advantages esp. for battery-powered transmitters backed up by solar cells. <IMAGE>
