Abstract (en)
[origin: WO9420724A1] The invention relates to a frame-forming construction comprising parts for forming a frame and associated connecting means. A fabric or plastic sheet is mounted firmly in the space defined by the frame. Each frame part (2) is comprised of a flexible profiled moulding extruded from polymeric material. The moulding is provided with longitudinally extending snap-on connecting elements (68, 11) which function to lock together the longitudinally extending outer ends of the moulding. The connecting devices (3) are intended to mutually connect at least the ends of the profiled moulding to form a closed frame, and the sheet of fabric (1) or the plastic sheet is firmly clamped by the snap-on connecting elements (68, 11).
