Abstract (en)
[origin: EP0687788A1] The door on opening and closing executes a rotary movement about a rotary axis (1) in the door opening. It has a door panel (4), and a first rotary bearing (12) forming the first rotary axis and displaceable in a straight guide parallel to the closed door, being connected to the door panel. The rotary bearing involves two arms (15), which on the one hand are fixed on the door frame (8) via a second rotary axis formed by a second rotary bearing and on the other hand are connected with the door panel via a third rotary connection (17) forming a third rotary axis. All three rotary axis are parallel to each other. The two arms are connected to a connecting part (14), arranged laterally to the door panel and laterally to the second rotary axis. <IMAGE>
