Abstract (en)

[origin: WO9421518A1] In a process for inserting several flexible foil packages into a package container, the support for the leading foil package is removed and the package container with the designated place for said foil package is taken to the region of said support. In a corresponding device, the upper web (36) of a conveyor belt (34) is taken by its leading deflection roller (40) from the region of the package container (1) and the package container (50) is correspondingly shifted. Thus each foil package (14) remains virtually still until it has been fully inserted into the package container (50).
