Abstract (en)

[origin: EP0727543A1] The correspondingly dimensioned through passage hole (3) in the apex area of a dome (4) is formed with a cupola-shaped upper side and for the pipe (2) a conformably shaped hood (5) is provided. The superimposed position of the hood on the dome (4) is secured by a support of the pipe in the area of the under side of the roof cover plate (1). The pipe is formed in two parts between which a coupling point is provided so that a tensioning of the superimposed position of the hood and the dome can be achieved. The support is obtained by a collar (K) of the one pipe part (2') which supports against the underside of the dome (4).
