Abstract (en)

The present invention provides a leakage tight or sift-proof container (10) comprising a lid (12). The pouring spout (25) is on the external skirt of said lid. Said lid comprises a horizontal wing (20) under said pouring spout. The top edge (14) of said container is pressed against said horizontal wing when said container is closed with said lid. This horizontal wing between said container and said lid prevents that the contained substance gets trapped in between the engagement mechanism between the container and the lid. Therefore it prevents that this trapped substance is lost on the outside of the container. <MATH>
