Abstract (en)

[origin: EP0691089A1] The device is for transferring slabs (4), each being transported on the endless chain conveyor (2) between fixed workstations (3) and carrying two upright pegs (13) with points for supporting a piece (15) on which a workpiece such as a shoe (1) is mounted for machining. The slab is transferred to each workstation by a bar (22) engaging in a dovetail slot (11) before being driven laterally by a magnetically coupled jack (24) under the worktable (19). The position of the slab w.r.t. pairs of lateral guides (20,21) is checked by means of three detectors (31,33,35) immediately ahead of retractable stops (32,34,36). The piece (15) is gripped between fixed and movable jaws (27,28) for the machining operation. The detectors are coupled to a programmable computer system. <IMAGE>
