Abstract (en)  
[origin: EP0691288A1] The device comprises a grip rail (7) which seizes the bin and is fixed on the lift frame (2) to swivel from a pick-up position (A) about a horizontal axis (9) towards the collecting container into a rest position (R) and back again. The lift frame (2) has an additional pick-up body with triangular pick-up claw (12) which is mounted fixed displaceable vertically from a lower rest position (R) into an upper pick-up position (A) and back again. A piston cylinder unit (17) between the grip rail (7) and pick-up body (11) can be operated to move the grip rail into the pick up position and the pick-up body into the rest position, and vice versa. This unit can be controlled by a signal from a reading/identification system. <IMAGE>
