Abstract (en)
[origin: EP0691708A1] A locking pin is formed adjacent to each slot opening in the transverse gap recess (4). A bevel is provided in the transverse gap recess for the locking slide carrying the locking pin. Locking elements between the locking slide and the housing enable a locked preassembly setting and a locked end assembly setting of the locking slide. The free ends of the locking pin are pressed by the locking bevels when the locking slide is moved from the preassembly setting into the end assembly sitting through the slot opening into the inner space of the respective contact element chamber. The slide has projections which overlap the sealing ring. <IMAGE>
