Abstract (en)

[origin: EP0692234A2] The suspension device comprises a lifting head (5) which has at least two positioning struts (8). The struts point downwards from the lifting head and at least one cable (16) is connected to the patient (29) from the struts. The lifting head has at least one crank (17) rotatably driven on a vertical crank axle (18), from each of which at least one cable (16) is connected to the patient. The lifting head can be horizontally and vertically adjusted. The positioning struts can swivel on a first horizontal swivel axle (13) in a neutral position for all the functional parts of the lifting head, and can be set at different angles by bolts (22) and holes (21). <IMAGE>
