Abstract (en)
[origin: EP0692312A1] The distributor comprises a common container (1) having two chambers filled with different fluids. Each chamber is closed by a valve pump, each valve being activated by a common push button. The push button has a chamber into which the outflowing fluids from the two valves discharge. The chamber is divided by a wall (7) so as to form two separate chambers (6',6'') into which the outflows from the two valves discharge. The wall has two outlet orifices (8',8'') connected to the two chambers. The outlet orifices discharge into cavities (10',10'') in a deformable distributing spout (11). The spout has an outlet slot (12) sealed by two lips which separate under pressure of the mixed fluid arriving in the cavities during pushing the push button. The spout has a middle wall (14) separating the cavities. <IMAGE>
