Abstract (en)

[origin: EP0692852A1] The device includes printed circuit patterns (12) which adhere onto a continuous band (10), which passes around two drums (18) in a container (3). The upper drum has protruding guide spigots (19). An attached roller (17) sliding on a sliding section (21) with a spring (34) is provided. A second roller (27) with a handle (29) slides on the slider and has an upper and lower stop (31,32). The band passes over an output slide (37) and through the outside of the container (36) to guide rails (40). The handle moves the printed circuit a set distance, and they slide over an external wedge shaped rail section (40a,40b) where a protruding tool is inserted in a hole in the band and separates each section of the printed circuit. <IMAGE>
