Abstract (en)
[origin: WO9522002A1] In a spinning pump for the melt extrusion of polyamides, drillings (10, 10') with partially circular cross-section are formed in the central plate (6) in such a way that the cross-sectional area of the drillings (10, 10') tapers towards the back (6'') of the central plate (6) and the centres of the drillings (10, 10') have a parabolic contour towards the back (6'') of the central plate (6). Drillings (10, 10') designed in this manner have made it possible to prevent cracked deposits inside the pump channels and increase the productivity of top-quality melt extrusion by over 10 %.
