Abstract (en)

The franking machine has a microprocessor (1) connected by an address bus (11) and a data bus (10) to a non-volatile memory (2) that holds the operating program for the franking machine. The non-volatile memory is flash memory with its address space divided into multiple sectors (S1-S8) selectively addressable from the address bus. An address decoder circuit (3) is connected between the address bus and a terminal (WE) of the memory circuit authorising or inhibiting writing to the memory. The address decoder is configured so the microprocessor is blocked from writing when the decoding circuit detects a control signal at first level and is allowed to write when the control signal is at the second level. The control signal level is set by an externally accessible removable link (4). <IMAGE>

Abstract (fr)

Un système d'affranchissement postal électronique comprenant un microprocesseur (1) connecté par un bus d'adresses (11) et un bus de données (10) à un circuit de mémoire non volatile (2) dans lequel est enregistré un programme d'exploitation du système d'affranchissement. Le circuit de mémoire est du type mémoire flash. Le programme d'exploitation est enregistré dans au moins des secteurs de la mémoire et il est prévu un circuit de décodage d'adresses (3) entre le bus d'adresses et une borne du circuit mémoire autorisant ou interdisant l'écriture dans ce secteur de la mémoire. <IMAGE>
