Abstract (en)
[origin: EP0694894A2] The signal lamp has the LED's (LED) supported within the lamp so that they can be pivoted between at least 2 different radiation directions. The LED's are positioned in groups via setting discs (VS), to allow the radiated light distribution to be matched to different requirements. Pref. the setting discs are controlled by an adjustment device, for linear or pivoted displacement of the LED's into the required light radiation position, each LED in the group fitted in a respective opening in the setting disc. <IMAGE>
