Abstract (en)
[origin: EP0695523A1] The system includes a locking hook (13) engaging in a recess (11) in the rail (9), and an adjusting wedge (23) movable in the lengthwise direction of the rail between its mounting side and the drawer. The hook is spring-loaded into the engaged position, and can be released from the latter by a handle (33) joined to it. The baseplate, hook, handle and wedge form a one-piece moulding. The hook and handle are joined to the baseplate via flexible plastics ribs (15, 17). The wedge is joined via fracture points to the baseplate, which has guides (24, 25) for it. After breaking the wedge off at the fracture points, it engages with holders (27) so that it cannot come loose. The hook can have a thickened shank where it bears against the rail and from which a flexible rib (15) runs parallel to the rail to a holding head (15a, 17a) joining onto the baseplate. A stiffer handle (16) extends at an acute angle from the rib, extending clear of the latter beyond the head.
