Abstract (en)

[origin: EP0695567A2] This invention refers to a shoe-foot for elastic doll legs incorporating a push-button switch which, being applicable preferably in that type of shoe-foot in which each doll elastic lower limb ends, said shoe-foot being made up of a cavity which purpose is to house the foot of the user or child, and retaining said foot inside said cavity through an elastic strip fitted to for that purpose to the rear end of the shoe-foot, is characterized because upon the lower surface of the corresponding sole of the shoe-foot itself is located an elastic bubble or nipple, inside which is housed a push button which actuation closes an electric power circuit that activates a sound emitting device incorporated in the doll itself; having foreseen that the sole be of an elastic nature, whereas the bubble or nipple housing the push button could be made up of the same or different material as said sole; all of the foregoing so that the action of resting the foot on the ground and corresponding pressure of the sole upon the ground will cause a deformation of the bubble or nipple and thus the actuation of the push button, recovering its at rest position when said pressure upon the ground ends. <MATH>
