Abstract (en)

The device object of the invention is made up from a flexible material hollow body which, acting as a bladder, is applied to the head of a doll so that said head is internally lighted whenever said flexible body of bladder is pressed, and all of the foregoing as consequence of inside it being mounted a bellows operated through an internal valve, so that whenever said bellows is actuated it shall cause the displacement of a pin capable of closing an electric circuit to which is connected a lamp duly supplied by way of a dry cell battery. Whenever the spring is in the resting position, the pin shall be in a position such that the circuit remains open. <MATH>
