Abstract (en)

[origin: EP0695685A2] Sack is filled with bulk material by a method in which the material is put in the sack, pref. formed from a polyethylene film tube, and the sack is sealed and then perforated by needles (7) mounted on a plate (4) and operated by a piston-cylinder unit over a specific area. The sack is then positioned so that the perforated area is precisely under an extractor (5) which removes air or air-dust mixture from the sack. The perforated area is then moved under a labelling unit (6) which applies a label.
