Abstract (en)

[origin: WO9426081A1] A process is disclosed for producing a printed circuit board with a first and a second face. A plurality of connections (pads) for soldering electronic components and a plurality of tracks which interconnect the pads are applied on at least the first surface. A layer of solder (6) is applied on the pads by means of a first photoresist layer (3); the tracks are structured thereon by etchants by means of a second photoresist layer (7) which remains on the tracks and on the layer of solder (6) applied on the connections (10) of the pads (4). A solder resist (8) may then be applied on the printed circuit board outside of the pads (4). A process is also disclosed for manufacturing a mask suitable for implementing this printed circuit board production process. According to said process, said masks are produced in a simple manner from known base masks.
