Abstract (en)

[origin: EP0697268A1] The locking part is formed as a U-shaped claw (13). The end edges of the claw legs (13a) engage vertically into axial recesses in the jacket surface of the tube (2). The claw is moved between locking and release positions by cam-shaped control surfaces (11a,b). These are formed on a turning ring (11), which moves to a limited degree on the hand grip (1). One end of the hand grip has a circular cylindrical bearing face for the turning ring. The ring is secured in axial direction by a sleeve, which may be locked on the grip.
