Abstract (en)

[origin: EP0697489A1] A socket sleeve (3) of steel or polymer concrete, plastics or other material is provided in the structural element (1) such as a step which is to be supported. A transverse force bolt (5) which interacts at one end with the socket (3) and protrudes at the other towards the other structural element (2) is held in the socket secured against rotation relative to its horizontal transverse axis by a lock (14,15) which can be removed after installation of the concrete step (1). The lock has two force transfer devices (14,15) spaced from each other in the axial direction of the pin and acting opposite each other in a vertical plane. At least one of the transfer devices can be a screw accessible from the outside face (16,11) of the step.
