Abstract (en)

The invention relates to a device for bending in one operation a series of parallel bars of a net, characterised in that it consists of bending means which are movable with respect to a frame and extend perpendicular with respect to the bars to be bent, with four pressure pieces being successively mounted both on the frame and on the movable bending means, the two inner pieces of which being situated on the one side and the two outer pieces on the other side with respect to the longitudinal axis of the bar and some of these pressure pieces may be movable with respect to the longitudinal axis of the bar, in such a manner that different bar diameters can be clamped. <MATH>
