Abstract (en)

[origin: DE4428285C1] In the push button switch a switch wing (51) is provided between the switch sliding member (22) and the spring ram (10). The switch wing is fixed w.r.t the switch housing and acts on the switch sliding member on one side and on the spring ram on the other side. The switch wing carries the spring ram in the switch on direction or switch off direction over a part of the distance of the contact stroke at the start of the switch on operation and of the switch off operation. After the part distance the spring switch mechanism (24,25,26) brings the spring ram into the switch on or switch off setting.
