Abstract (en)
[origin: WO9426538A1] Method of mass production and surface treatment of supports with a plane or non-plane, translucent, transparent or opaque surface for glass roofs, composite glazing, doors, windows, floors, walls, ceilings or other applications such as furniture, bottles, phials, containers. The method is characterized by screen printing a pattern in colour and then a grid using conductive inks containing from 50 to 80 % of silver or any other highly conductive metal. The supports are then successively dipped in a first electrolytic or chemical copper bath, then in a second electrolytic or chemical nickel bath or any other metal resistant to corrosion and suitable for these metallizing methods. The invention also concerns the products obtained.
