Abstract (en)

[origin: EP0699508A1] The switch-off unit has an adjusting element (23), standing and located int he motor shaft of the compressed air motor (4), and is in pressure conducting communication with the pressure building cylinder chamber of the impact mechanism. A torque related signal is transmitted to the switch-off unit across the adjusting element (23). With the reaching of a specified torque limit value, the pressure supply to the compressed air motor is interrupted. The adjusting element (23) reacts on a transverse beam (27), which is provided with at least one measurement value pick-up, designed pref. as a strain gauge strip (31). For determining a bending moment depending on a pulse pressure in the impact mechanism cylinder chamber (14), this bending moment is compared in a pref. electronic evaluation unit (40) with a specified torque limit value. When this is reached the switch-off unit is operated
