Abstract (en)

[origin: EP0699597A1] The dispenser is used with a pressurised container with a valve, and consists of a valve actuating stem (4a,4b) with a channel extending between an outlet (12) and the valve. The stem has at least one cavity (13) situated below the level of the outlet channel (9) and in which the product can collect once the container is left at rest. The cavity is situated in an angled portion of the channel to one side of its vertical section adjoining the outlet. In variants of the design the collection cavity can be situated at the lower end of the channel, below the level of the valve or around the outlet.
