Abstract (en)

[origin: EP0699868A1] The procedure for burning sludge consists of dehydrating the sludge by centrifuging and drying using heat produced by an incineration furnace, and then introducing the dried sludge into the furnace in a pulverised form together with the domestic waste. The sludge dehydration stage is integrated in a circuit in which fumes from the incinerator are treated, diluted with air and their heat extracted. The procedure is carried out using a furnace with a fluidised bed, and a dilution/atomisation chamber in which heat is extracted from the furnace fumes, with a filter to remove ash from the fumes, and a drying centrifuge.
