Abstract (en)
[origin: EP0700649A1] The guide housing fixed to the rail (4) contains a connection (7) joined to a tension spring (15). A holder (10) protrudes out of the housing which has opposite facing ducted flanges (5,6). One ducted flange (6) acts a linear guide and covers the entire adjustment range of the connection. The side of the connection facing away from the holder has a hooked protuberance (16) which fits into an opening (17) or recess, at the end of the pull-out path and by tilting the connection into a release tilted portion. The opening or recess is positioned in the linear ducted flange (5).
