Abstract (en)

[origin: EP0700821A1] A tractor having a steerable axle (15) that pivotally moves laterally in response to a corresponding steering action of the steerable wheels (17) mounted on the steerable axle (15) is disclosed wherein the steering linkage includes alternative tie rod mounting positions (51, 52) to provide different selectable steering behaviours. The connection of the tie rods (28) at a first position provides a predetermined amount of pivotal movement of the front wheels (17) for a given amount of corresponding pivotal movement of the front axle (15) to which the wheels (17) are mounted. An alternative second position changes the amount of pivotal movement of the front wheels (17) for the given amount of axle movement to provide a more suitable steering performance when the front wheels (17) are laterally spaced at a different tread setting. Accordingly, the compound steering mechanism can be selected for optimum steering performance with wide or narrow tread settings. <MATH>
