Abstract (en)  
[origin: EP0700860A1] An elevator car platform includes a base (12) constituted by a layer made of a light rigid composite material which is coated on its sides by two rigid skins (14), a sensitive layer (26) acting as a load scale secured to the upper skin (16), an insulating cushion (28) made of an elastic material covering said sensitive layer and ensuring the acoustic and antivibratory insulations of the car, a floor (30) made of a light rigid material and coated with two rigid skins (32,34), said floor covering the entire surface of the insulating cushion except for a zone having a constant width and extending along the entrance edge of the car, and a door-sill profile (40) having the same dimensions as said zone and provided with an upper flat face on which grooves (42) are formed for guiding the lower edges of the doors, said profile being fixed in said zone so that its upper face is substantially at the same level as the upper face of the floor (30). <MATH>
