Abstract (en)

[origin: WO9429025A1] A device of the kind comprising a frame (1) and an element (2) rotatably supported therein includes a drive assembly (17) arranged at the frame (1), said drive assembly having an output drive axle (16) drivingly connected to a first end of the element (2). Means (18) are provided to support the drive assembly (17) relative to the frame and prevent a body (19) of the drive assembly to rotate relative to the frame. A bearing (20), which is provided for the output drive axle (16) and comprised in the drive assembly (17), is also arranged to function as a rotation bearing for the rotatable element (2) as a consequence of the latter being supported relative to the frame (1) via the output drive axle (16).
