Abstract (en)
[origin: EP0702126A1] The two side bearer parts between which the winding shaft is rotatably fitted are connected with the upper end of guide rails. In the upper area of at least one guide rail a stop is arranged, which works in conjunction with a counter stop pref. on the lowermost roller blade component in order to prevent the component being drawn upwards over the stop. The stop (9) is movable by the bearer parts (2) connected with the guide rails (1) out of the area of the guide rail guiding the roller blind. The roller blind component (6) provided with the counter stop (10) can be drawn upwards over the height of the stop.
