Abstract (en)  
[origin: EP0702383A1] The doorbell button has a mounting plate (1) receiving a housing (2) containing the nameplate, with a relatively displaced operating button, for providing an acoustic doorbell signal upon closure of an electrical circuit. The housing has a plastics base part (3) and a separate metal frame (4), which fully covers the base part in the installed position. Pref. the base part and the frame are coupled together via interlocking retaining elements (16a, 16b, 17), e.g. perpendicular projections (16a) at the rear of the frame with locking noses (16b) adjacent their free ends, locating behind a recessed edge (17) provided by the base part.
