Abstract (en)

[origin: EP0702489A2] A method for controlling the recording of repeat-transmission contributions for an entertainment electronics recorder allows a user, or service personnel, to program the recorder device without high outlay on servicing or operating costs, and without taking the device out of service for an indefinite period of time. Identification marking the transmitted contribution to be recorded takes place only after a successful start of the transmission, with detection and storage of at least one part of the transmission of the same parts of the auxiliary data from the auxiliary data sent with the indicated transmission contribution.
