Abstract (en)
[origin: EP0702907A1] The ski boot lining consists of an upper (7) which covers the foot and a leg section (2,6) of plastics with inward-facing studs (12) which are of variable height, distribution density and material, depending on the area of the leg or foot covered by them. For example, in the area of the ankle bones the studs reduce in height and leave a zone without studs in the centre. The studs (12) are truncated conical in shape and are covered with a layer (13) of a foam material of varying density, depending on the area covered.
