Abstract (en)
[origin: WO9528667A1] First and second robots (R1, R2) are placed apart from each other on a track (2) and caused to grab a component on supply conveyor lines (SP1, SP2) by hand at respective positions. Then, the robots (R1, R2) are moved to approach each other on the track (2), and stopped at positions where they are closest to each other. The two robots (R1, R2) are caused to select and grab a hand on a rotary hand placing table (4) and are switched from a state that a two-arm-cooperation mode is released to a state that the mode is put into effect by means of a robot control device. Then, the assembly job on a common assembling table (TB) is performed.
