Abstract (en)
[origin: EP0705762A1] The transporter pulley (7) has an axis (24) and a link member (29) which is pivoted about this axis. The link circumference carries one or more locking arms. In drive direction of the pulley, the arm engages positively into recesses in direction of rotation of the pulley only. The link member also carries a peg (28), which projects outwards parallel to the pivot axis. The radial distance between peg and axis of the transporter pulley is smaller than the radius of the pulley. The slide (27) is fastened pivoted to the peg. For transporter device removal, the chain of parts transmitting the drive movement to the link member may be interrupted.
